YAML

YAML is used for templates in Kubernetes, Deployment Manager as well.

Modify your files as normal.

Describe your resources and add resources via your YAML file.

```yaml
apiVersion: extensions/Version1.2

kind: Deployment

metadata: Describe here

  name: myapp-deployment

spec:

  replicas: 1

  selector:

    matchLabels:

      app: myapp

  template: myapp1

    metadata:

      labels:

        app: myapp

    spec:

      containers:

      - name: myapp-container

        image: myapp/newlocation:1.2

      ports:

        - containerPort: 80

        - containerPort: 443
```

Line 1- Api Version

Line 2 - Resource Type

Line 3-8 Pod Properties

Line 9 - App (Selector)

Line 1-9 are the Deployment

Line 10-19 is the Template
